1. An application deployed on a VM is not reachable from the internet. VM is running and has a public IP. How will you troubleshoot this step by step?
2. You are unable to RDP/SSH into a production VM. What all checks will you perform before restarting the VM?
3. VM Scale Set is not scaling out even when CPU usage is high. How will you identify the issue?
4. Application Gateway shows backend pool as unhealthy, but the application works fine when accessed locally. How will you troubleshoot?
5. You are using Azure Bastion, but still cannot connect to a VM. What could be wrong?
6. A storage account exists, but the application cannot upload or download data. How will you troubleshoot?
7. Application suddenly lost database connectivity in Azure. How will you troubleshoot this?
8. Azure SQL Database is up, but application gets connection timeout errors. How will you debug?
9. Application is failing because it cannot read secrets from Azure Key Vault. How will you troubleshoot?
10. A critical production resource was accidentally deleted by a user. How will you restore it and how will you prevent this in the future?
11. The App Service shows Running state, but users cannot access the application URL. How will you troubleshoot?
12. Users are getting 502 or 503 errors from the Web App. Where will you check first and why?
13. Web App is up, but it cannot connect to Azure SQL / database. How will you troubleshoot the dependency?
14. Application works fine in staging slot but fails after slot swap to production. What could be wrong?
15. Function App is deployed successfully, but the function is not triggering. How will you troubleshoot?
16. Function App fails when calling an external API or database. How will you identify whether the issue is code or dependency related?
17. Logic App workflow suddenly started failing. How will you identify which step is causing the failure?
18. Logic App is unable to connect to a third-party service or Azure service. How will you troubleshoot?
19. Application is failing because it cannot read secrets from Key Vault. What all checks will you perform?
20. Application works fine normally but becomes slow during peak hours. How will you decide whether to scale App Service Plan or optimize dependencies?

Linux Interview Questions: (3–5) Years Experience

1. A production Linux server is not reachable via SSH. Users say the application is down. How will you troubleshoot step by step without rebooting immediately?
2. Linux server CPU usage is constantly above 90%, but application traffic is normal. How will you identify the root cause?
3. Root filesystem is 100% full on a production server and applications have stopped. How will you resolve this without downtime?
4. Application is getting killed automatically and you see Out Of Memory errors. How will you troubleshoot and fix this?
5. After a server reboot, an application service failed to start automatically. How will you troubleshoot?
6. System is slow, but CPU and memory look normal. How will you identify the issue?
7. A large log file was deleted, but disk space is still not freed. Why and how will you fix it?
8. Application service is running, but the port is not listening. How will you troubleshoot this?
9. Application worked earlier, but after deployment it fails with permission denied errors. How will you troubleshoot?
10. A log file is growing very fast and filling up disk space daily. How will you control and perman

Git & GitHub Interview Questions: (3–5) Years Experience

1. A developer says their commits disappeared after doing a pull or reset. How will you recover the lost commits?
2. After merging a feature branch into main, production broke. How will you identify the problematic commit and fix it without affecting other changes?
3. While rebasing a long-running feature branch, multiple conflicts occurred. How will you resolve them safely and ensure nothing breaks?
4. A pull request was approved and merged into the main branch on GitHub, and production broke. How will you identify the issue and fix it quickly without blocking other developers?
5. A developer accidentally pushed credentials to a GitHub repository. What immediate and long-term actions will you take?
6. CI/CD pipeline started failing after GitHub branch protection or permission changes. How will you troubleshoot and fix it?

Git Strategy & Branching :

1. Your team works on multiple features in parallel, with Dev, QA, and Production environments. How will you design a Git branching strategy to support parallel development, controlled releases, and hotfixes?
2. A critical bug is found in production and needs an immediate fix, while ongoing development is happening in other branches. How will you apply the fix without disturbing current work?

Terraform Interview Questions: (3–5) Years Experience

1. Terraform deployment suddenly fails with authentication errors in Azure. How will you troubleshoot and fix this?
2. Terraform state file is locked or corrupted in a shared environment. How will you recover safely without breaking existing resources?
3. You need to use the same Terraform code for Dev, Test, and Prod. How will you design it?
4. Terraform plan shows deletion of critical production resources. How will you stop this and fix the configuration?
5. Someone manually changed resources in Azure Portal. Terraform plan now shows differences. How will you handle this drift?
6. Sensitive values are required in Terraform, but security team does not allow hardcoding. How will you manage this?
7. Terraform apply failed halfway and some resources were created. How will you bring Terraform back to a consistent state?
8. Multiple teams want to reuse Terraform code while maintaining standards. How will you design this?

Azure DevOps Interview Questions: (3–5) Years Experience

1. You are starting a new enterprise project with changing requirements. How will you decide between Waterfall and Agile, and how will you reflect that choice in Azure DevOps?
2. You are working in Scrum. How will you structure Epics, Features, and User Stories in Azure Boards for a large project?
3. A production issue is reported by users. How do you decide whether to create a Bug or a User Story, and how do you prioritize it?
4. Your organization requires approvals before moving work items to Done. How will you design workflows and approvals in Azure Boards?
5. Explain how you would implement a complete project lifecycle using Azure Boards, Repos, Pipelines, Test Plans, and Artifacts.
6. You are asked to move from Classic pipelines to YAML pipelines. How will you design a CI build pipeline using YAML?
7. You need to deploy to Dev automatically but require manual approval for Prod. How will you design your Release pipeline?
8. Pipeline fails due to authentication issues while deploying to Azure. How will you troubleshoot Service Connections and Agent Pools?
9. Code quality checks are mandatory before merge. How will you integrate SonarQube with Azure DevOps and enforce quality gates?
10. Your build depends on shared libraries used across teams. How will you manage artifacts and versioning in Azure DevOps?

Docker Interview Questions: (3–5) Years Experience

1. A Docker container starts and exits immediately. How will you troubleshoot this issue?
2. Docker container is running, but application is not accessible from the host or browser. How will you debug?
3. Your Docker image size is very large and slowing down CI/CD pipelines. How will you reduce it?
4. A container is consuming too much CPU or memory on the host. How will you identify and fix this?
5. Application inside a container is not picking up environment variables. How will you troubleshoot?
6. Docker container works fine locally but fails in production. How will you identify the difference and fix it?

Kubernetes Interview Questions: (3–5) Years Experience

1. Pods are going into Crash Loop Back Off in production. How will you troubleshoot step by step?
2. A pod is stuck in Pending state for a long time. What could be the reasons and how will you debug?
3. Pods are running, but application is not accessible through the Kubernetes Service. How will you troubleshoot?
4. One of the Kubernetes nodes shows Not Ready status. How will you investigate and fix it?
5. Cluster CPU and memory usage is very high. How will you identify which workloads are causing this?
6. Horizontal Pod Auto scaler is configured, but pods are not scaling during high traffic. How will you debug?
7. Pods are failing with Image Pull Back Off error. How will you troubleshoot?
8. You updated a Config Map or Secret, but application pods are still using old values. How will you fix this?
9. After a rolling update deployment, users experienced downtime. How will you prevent this next time?
10. Pods from one namespace cannot communicate with pods in another namespace. How will you troubleshoot?

Monitoring tools – Prometheus, Grafana, and Azure Monitor

1. Your AKS cluster is running multiple microservices, and some pods are intermittently restarting. How would you use Prometheus to detect the root cause, and which metrics would you analyse first?
2. You are migrating workloads from on-prem monitoring to Azure. In a scenario where security policies restrict inbound access, how would monitoring behaviour differ between Prometheus and Azure Monitor, and which would you choose?
3. Multiple teams want a single dashboard to track application latency, CPU usage, and request failures across AKS and Azure services. How would you design this using Grafana, and how would you manage access control?
4. A critical production alert fires too frequently, causing alert fatigue. In this scenario, how would you tune alerting rules using Prometheus Alert manager compared to **Azure Monitor Alerts?
5. Your application experiences high latency during peak traffic, but Azure infrastructure metrics look normal. How would you correlate application-level metrics from Prometheus with platform metrics from Azure Monitor using Grafana to identify the bottleneck?
