SUMMARY

Azure DevOps Engineer with 4 years of experience in CI/CD, Terraform, Kubernetes, Docker, and Azure cloud services. Skilled in automating infrastructure provisioning, optimizing cloud costs, and managing end-to-end DevOps pipelines

EXPERIENCE

Project:

Accenture **July 2024 - Present, Hyderabad**

- Reduced infrastructure costs by **35%** by optimizing Jenkins nodes and implementing Azure CI/CD pipelines.
- Automated deployments using **YAML scripts** and managed **Jenkins, SonarQube, Bitbucket** as administrator. Created **Jenkins** pipeline in both prod and dev. Resolved pipeline issues in Jenkins.
- Worked on migrating code quality rules from **SonarQube to CodeScan**, including extracting, mapping, and configuring rules to ensure alignment with existing quality gates and standards.
- Reviewed CodeScan scan results to flag false positives, enhanced rule coverage by adding new rules, and configured Azure user groups for role-based access and project governance.
- Upgraded tools across Dev/Prod environments, ensuring zero downtime.
- Implemented and managed **Single Sign-On (SSO**) integration for **Jenkins**, **SonarQube and Code scan**, enhancing secure and seamless user authentication across ALM production environment.
- Created and managed **Azure AD Access Control Administrator (ACAM) groups** for guest users, including provisioning groups and adding external users to enforce secure and organized access.
- Optimized pipeline performance by implementing configuration changes and removing unused pull requests across four organizations, significantly reducing build time.
- Developed **Terraform scripts** for resource provisioning and managed **AKS clusters**.
- Handled **certificate renewals (SonarQube, Jenkins, Bitbucket)** and optimized VM configurations (disk size, snapshots).
- Maintained and updated **Azure Service Principal secrets** for Jenkins and SonarQube integrations in production environments, ensuring secure authentication and compliance.
- Worked with **Azure Repos, Pipelines, Storage, and Data Factory** for seamless integrations.
- Maintained applications such as **Jenkins, SonarQube and Bitbucket** completely as administrator.
- Worked with various teams to remove unused resources in Azure portal.
- Implemented a release pipeline in Azure DevOps to start and stop **Azure Kubernetes Service (AKS)** dev clusters on demand using Azure CLI, reducing non-production infrastructure costs through automated scaling.
- Automated **ACR image cleanup** using Azure DevOps pipeline and Bash; deleted outdated images (>90 days) monthly while preserving critical release tags
- Developed an Azure DevOps pipeline to automatically identify and delete untagged (dangling) container image manifests in **Azure Container Registry** older than 100 days, reducing storage bloat and improving image hygiene.
- Implemented **Bitbucket upgrade** from scratch on Kubernetes, including environment setup, Helm configuration, and migration, resulting in improved scalability and maintainability.
- Performed **PostgreSQL upgrade** by provisioning a new database instance, restoring production data, and reconfiguring Bitbucket connections for uninterrupted functionality.
- Implemented **Kubernetes version upgrade** via CI/CD pipeline automation, streamlining cluster management and minimizing manual intervention.
- Decommissioned the **SonarQube** instance from the Kubernetes cluster after successful migration to Code Scan.
- Handled **SPN certificate renewals** by raising service requests and updating the renewed certificates in the required tools to ensure uninterrupted application connectivity.

Project:

Accenture **November 2021 - July 2024, Hyderabad**

- Monitored **2,000+ batch processes** across 6 VMs, ensuring 99.9% on-time execution.
- Built **100+** new batch processes to parse, create and upload 5+ different files types like AFP, CSR, text files etc.
- Transitioned from **Teradata** to **Snowflake** cloud data warehouse for scalability, cost efficiency and improved performance.
- Redesigned and rewritten **20+** complex queries from Teradata to Snowflake, optimized for tables with **300-400** columns.
- Upgraded VMs, managed snapshots, and deallocated unused resources, cutting costs by **20%**.
- Automated file transfers using **WinSCP** and modified configurations via **HxD**.
- Developed over **10** shell scripts to save efforts for log scraping, monitoring and to automate processes for repetitive tasks.
- Configured TWS scheduler, to create over **1800** jobs and related job streams to run based on particular events or time.
- Monitored failed jobs in **Linux** and resolved them by verifying file formats and coordinating with different teams to obtain the required files.
- Worked on **Groovy scripts** for production support, modifying and optimizing them as needed to ensure proper execution and data format compliance.
- Reduced container costs by enabling **CI/CD pipelines** and optimizing memory/CPU limits.
- Reduced unused resources of **Non BDS apps** in azure portal (Vm, PE, Load balancer).
- Worked on job failures in **Tivoli Workload Scheduler (TWS)**, identifying root causes and implementing fixes to ensure successful job execution.
- Made sure all the processes ran as expected with reference to the previous **Mainframe system**, analyzed daily batch run reports and monthly database statistics.

SKILLS

Cloud & DevOps: Azure DevOps, Azure Portal, AKS, Azure Data Factory, Azure Key Vault, Azure Databricks, Terraform, Storage Accounts, Disks, Azure Database, Kubernetes, CI/CD Pipelines.

Tools & Platforms: Jenkins, Bitbucket, Code scan, SonarQube, Git, Tivoli Work Scheduler, WinSCP, Shell Scripting, PgAmin, K8lens,Confluence.

Certifications: Microsoft Certified: Azure Administrator Associate (AZ-104), Microsoft Certified: Azure Fundamentals (AZ-900)

PROJECTS

Billing Data Services (BDS) – **AT&T**:

An enterprise-scale billing and account management platform enabling seamless data exchange across multiple systems. Contributed to backend and UI enhancements, REST API development, and cloud migration from on-premises servers to Azure.

Unilever Hindustan Limited:

An enterprise-scale DevOps optimization initiative focused on automating CI/CD pipelines, managing AKS clusters, and reducing infrastructure costs through Azure and Terraform. Led administration of Jenkins, SonarQube, and Bitbucket with secure integrations, performance tuning, and end-to-end automation

EDUCATION

Bachelor's of Technology Computer Science and Engineering

CMR Technical Campus, Hyderabad 2017 - 2021
